

PrimeHealth ER Analytics Dashboard

Olufunmilola Lanade
Healthcare Data Analyst | Excel Analytics

Project Overview

This project analyses Emergency Room (ER) performance using Excel dashboards, focusing on patient flow, wait times, admissions, satisfaction, and operational efficiency.

Dashboard Overview

Key Insights with Visual Evidence

Patient wait time analysis shows that over 60% of patients experienced delays, highlighting a critical bottleneck in triage and resource allocation.

Gender distribution is balanced, indicating no bias in patient demographics accessing ER services.

Weekend (Saturday) and mid-week peaks indicate uneven patient demand, requiring better staffing allocation.

Majority of patients had no referral, while General Practice dominated referrals, indicating ER overload for primary care cases.

Race distribution shows majority of White patients, with diverse representation across other groups.

Age group distribution is fairly consistent, with slight peaks in middle-aged patients, indicating typical ER usage patterns.

Key KPI Snapshot

No of Patient	Avg Wait tim	Patient Satisfaction	Average of Billing Amount	Average of Length of Stay
2275	43.3	5.48	\$7,491.72	3.3 days

Admission Status	No of Patient	%
Admitted	1161	51.03%
Not Admitted	1114	48.97%
Grand Total	2275	100.00%

Business Impact

Prolonged wait times may increase patient risk, reduce satisfaction, and strain hospital resources. High patient volumes during night shifts and weekends can lead to staff burnout and reduced service quality. Inefficient admission processes may delay treatment and impact patient outcomes.

Recommendations

Increase staffing during peak periods. Improve admission-to-bed workflow. Monitor wait times in real-time. Redirect non-emergency cases to primary care.
